

How to manage URL redirects

Redirects allow you to make a specific web page redirect to another page and display the contents of that page. This way you can make a page with a long URL accessible by a page which has a shorter and easier to remember URL.

1. Click the Redirects icon under the Domains section.
2. Choose whether you want this redirect to be temporary or permanent.
3. Type in the URL that you want to redirect.
4. Type in the destination URL.
5. Click the Add button to continue.
6. That's it! You've just created a URL redirect.
