

## **Doteasy KB**

### **Latest Visitors**

This function will show information regarding the last 300 people to visit your website. To begin, click the button under the View heading next to the desired domain name.

The records here will show the visitor's IP address, the HTTP code the visitor received, the date and time of the visit, the HTTP version, and the amount of information accessed in bytes. You will also see the referrer (the site from which the visitor was linked, if any), and the agent, or browser.

This information can be useful in monitoring repeat visitors to your website, allowing you to tailor the content to fit your visitors' needs.
